Trade and Portfolio Analysis Database System

Database Design, Implementation, and Trade Analytics

Group 173 Yanggao
Yingqi Tan Zhesheng Xu Hao Yang

MISY330 Database Design and Implementation
Spring 2026

Business Overview

- This project models a trade and portfolio analysis business that tracks stocks, exchanges, market data, strategies, factors, and trading records.
- A database is needed because trade analysis depends on structured relationships across companies, exchanges, portfolios, tax rules, and transaction history.
- The system supports practical tasks such as tax calculation, FIFO cost matching, factor-based stock screening, realized profit monitoring, and cross-market comparison.
- Business benefits include consistent record keeping, reusable query logic, faster reporting, and better decision support for portfolio management.

Database Scope and Main Entities

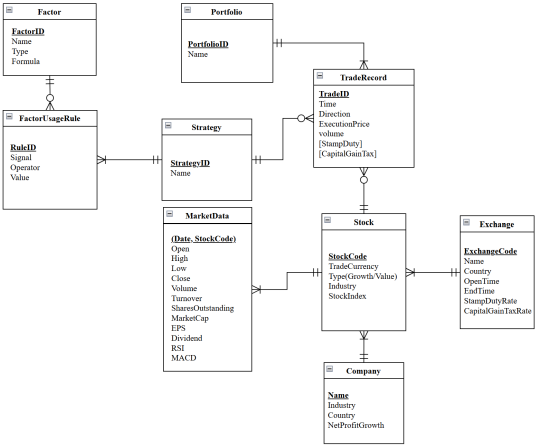
- The database covers the full workflow from reference data to trade reporting.
- `Company`, `Exchange`, and `Stock` define the market structure.
- `MarketData` stores daily valuation and indicator information.
- `Portfolio` and `TradeRecord` capture holdings and executed transactions.
- `Strategy` stores investment approaches used for trades.
- `Factor` stores screening dimensions such as PE ratio, dividend yield, RSI, and MACD.
- `FactorUsageRule` links factors to strategies through buy/sell rules.
- Together, these tables support tax analysis, FIFO matching, stock screening, and realized P&L reporting.

How the System Works

- The database is built in layers so each part of the business process has a clear role.
- **Reference layer:** `Company` stores issuer fundamentals, `Exchange` stores market rules and tax rates, and `Stock` connects each tradable ticker to its company and exchange.
- **Market layer:** `MarketData` stores date-based observations such as close price, EPS, dividend, RSI, and MACD for later valuation and factor analysis.
- **Decision layer:** `Factor`, `Strategy`, and `FactorUsageRule` model how screening rules are translated into buy and sell signals.
- **Transaction layer:** `Portfolio` identifies the investment account, and `TradeRecord` stores the executed trades with quantity, price, tax fields, selected strategy, and linked stock.
- **Analysis layer:** SQL queries combine these tables to calculate taxes, apply FIFO logic, summarize realized P&L, and screen securities for investment decisions.

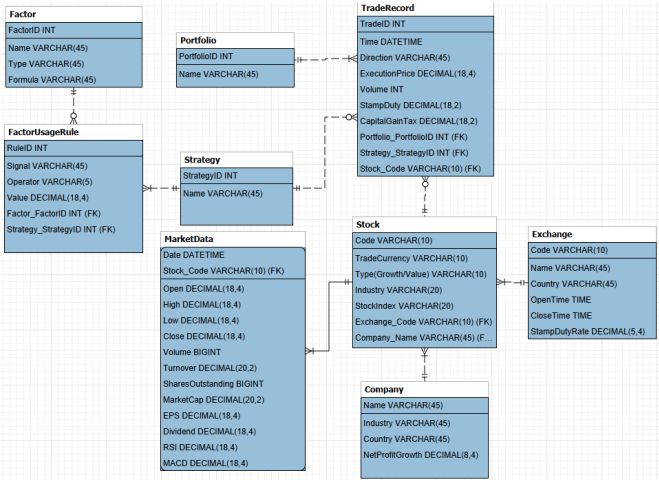
ER Diagram

- The ER diagram shows 9 entities, which satisfies the requirement of at least 8 entities.
- Primary keys identify each table, and foreign keys connect the business workflow from reference data to transactions.
- Major relationships include Exchange–Stock, Company–Stock, Stock–MarketData, Portfolio–TradeRecord, and Strategy–FactorUsageRule.
- `TradeRecord` is the central transaction table because each trade belongs to one portfolio, one strategy, and one stock.



Logical Data Model

- The logical model translates the ER design into implementation-ready tables and relationship directions.
- `FactorUsageRule` is the key associative table that resolves the many-to-many relationship between `Strategy` and `Factor`.
- `MarketData` uses a composite key of date and stock code to store time-series market observations.
- Optional tax fields in `TradeRecord` support later update queries for stamp duty and capital gain tax.



Database Implementation

- The schema was implemented in MySQL Workbench, and `GroupProject.sql` creates the database, tables, keys, and sample data.
- Parent tables are created first, then dependent tables such as `Stock`, `MarketData`, `FactorUsageRule`, and `TradeRecord`.
- The script loads sample records and keeps PK/FK links consistent so later tax, FIFO, and reporting queries can run directly on the same dataset.

Algorithm: `Create database`

```
Create parent tables and PK/FK rules
Insert lookup data
Load dependent tables

Run update and analysis queries
```

Query 1 SQL: FIFO Cost Basis Check

```sql
WITH TradeFlow AS (
    SELECT
        tr.*,
        SUM(CASE WHEN tr.Direction = 'Buy' THEN tr.Volume ELSE 0 END)
            OVER (
                PARTITION BY tr.Stock_Code, tr.Portfolio_PortfolioID
                ORDER BY tr.Time ASC, tr.TradeID ASC
            ) AS Cum_Buy,
        SUM(CASE WHEN tr.Direction = 'Sell' THEN tr.Volume ELSE 0 END)
            OVER (
                PARTITION BY tr.Stock_Code, tr.Portfolio_PortfolioID
                ORDER BY tr.Time ASC, tr.TradeID ASC
            ) AS Cum_Sell
    FROM TradeRecord tr
)
SELECT
    tf.TradeID,
    tf.Portfolio_PortfolioID,
    tf.Stock_Code,
    tf.Direction,
    tf.Volume,
    tf.ExecutionPrice,
    CASE
        WHEN tf.Direction = 'Sell' THEN (
            SELECT tr_b.ExecutionPrice
            FROM TradeRecord tr_b
            WHERE tr_b.Stock_Code = tf.Stock_Code
              AND tr_b.Portfolio_PortfolioID = tf.Portfolio_PortfolioID
              AND tr_b.Direction = 'Buy'
              AND (
                    SELECT SUM(tr_x.Volume)
                    FROM TradeRecord tr_x
                    WHERE tr_x.Stock_Code = tf.Stock_Code
                      AND tr_x.Portfolio_PortfolioID = tf.Portfolio_PortfolioID
                      AND tr_x.Direction = 'Buy'
                      AND (
                            tr_x.Time < tr_b.Time
                            OR (tr_x.Time = tr_b.Time AND tr_x.TradeID <= tr_b.TradeID)
                          )
                  ) >= tf.Cum_Sell
            ORDER BY tr_b.Time ASC, tr_b.TradeID ASC
            LIMIT 1
        )
        ELSE NULL
    END AS FIFO_Cost_Basis
FROM TradeFlow tf;
```

Query 1 Result: FIFO Cost Basis Check

- FIFO matches each sell trade to the earliest eligible buy in the same stock and portfolio.
- NVDA sells match the expected buy prices, while trade 20 has no prior buy match.

TradeID	Portfolio_PortfolioID	Stock_Code	Direction	Volume	ExecutionPrice	FIFO_Cost_Basis

Query 2 SQL (Part 1): Stamp Duty Update

```sql
UPDATE TradeRecord tr
JOIN Stock s ON tr.Stock_Code = s.Code
JOIN Exchange e ON s.Exchange_Code = e.Code
SET tr.StampDuty = ROUND(
    CASE
        -- HK stocks: both buy and sell are charged
        WHEN e.Code = 'HKEX'
            THEN tr.ExecutionPrice * tr.Volume * e.StampDutyRate

        -- A-shares: only sell is charged
        WHEN e.Code IN ('SSE', 'SZSE') AND tr.Direction = 'Sell'
            THEN tr.ExecutionPrice * tr.Volume * e.StampDutyRate

        -- US stocks or A-share buys
        ELSE 0
    END
, 2);
```

Query 2 SQL (Part 2): Capital Gain Tax Update

```sql
SET SQL_SAFE_UPDATES = 0;

UPDATE TradeRecord tr
JOIN (
    SELECT
        t_all.TradeID,
        (
            SELECT t_b.ExecutionPrice
            FROM TradeRecord t_b
            WHERE t_b.Stock_Code = t_all.Stock_Code
              AND t_b.Portfolio_PortfolioID = t_all.Portfolio_PortfolioID
              AND t_b.Direction = 'Buy'
              AND (
                    SELECT SUM(tb2.Volume)
                    FROM TradeRecord tb2
                    WHERE tb2.Direction = 'Buy'
                      AND tb2.Stock_Code = t_all.Stock_Code
                      AND tb2.Portfolio_PortfolioID = t_all.Portfolio_PortfolioID
                      AND (
                            tb2.Time < t_b.Time
                            OR (tb2.Time = t_b.Time AND tb2.TradeID <= t_b.TradeID)
                          )
                  ) >= (
                    SELECT SUM(ts2.Volume)
                    FROM TradeRecord ts2
                    WHERE ts2.Direction = 'Sell'
                      AND ts2.Stock_Code = t_all.Stock_Code
                      AND ts2.Portfolio_PortfolioID = t_all.Portfolio_PortfolioID
                      AND (
                            ts2.Time < t_all.Time
                            OR (ts2.Time = t_all.Time AND ts2.TradeID <= t_all.TradeID)
                          )
                  )
            ORDER BY t_b.Time ASC, t_b.TradeID ASC
            LIMIT 1
        ) AS FIFO_Cost
    FROM TradeRecord t_all
    WHERE t_all.Direction = 'Sell'
) AS fifo ON tr.TradeID = fifo.TradeID
JOIN Stock s ON tr.Stock_Code = s.Code
JOIN Exchange e ON s.Exchange_Code = e.Code
SET tr.CapitalGainTax = ROUND(
    GREATEST(tr.ExecutionPrice - fifo.FIFO_Cost, 0) * tr.Volume * e.CapitalGainTaxRate,
    2
)
WHERE e.CapitalGainTaxRate > 0;
```

Query 2 SQL (Part 3): Tax Result Check

```sql
SELECT
    tr.TradeID,
    tr.Stock_Code,
    tr.Direction,
    e.Code AS Exch,
    tr.ExecutionPrice,
    tr.Volume,
    tr.StampDuty,
    tr.CapitalGainTax
FROM TradeRecord tr
JOIN Stock s ON tr.Stock_Code = s.Code
JOIN Exchange e ON s.Exchange_Code = e.Code
ORDER BY tr.Time ASC, tr.TradeID ASC;
```

Query 2 Result: Updated Tax Results by Exchange

- Tax fields are updated by joining each trade to the exchange-specific stamp duty and capital gain tax rules.
- HKEX trades show stamp duty, while profitable US sells such as NVDA and COST show capital gain tax.

                  AND t_b.Direction = 'Buy'
                  AND (
                        SELECT SUM(tb2.Volume)
                        FROM TradeRecord tb2
                        WHERE tb2.Direction = 'Buy'
                          AND tb2.Stock_Code = tr_sell.Stock_Code
                          AND tb2.Portfolio_PortfolioID = tr_sell.Portfolio_PortfolioID
                          AND (
                                tb2.Time < t_b.Time
                                OR (tb2.Time = t_b.Time AND tb2.TradeID <= t_b.TradeID)
                              )
                      ) >= (
                        SELECT SUM(ts2.Volume)
                        FROM TradeRecord ts2
                        WHERE ts2.Direction = 'Sell'
                          AND ts2.Stock_Code = tr_sell.Stock_Code
                          AND ts2.Portfolio_PortfolioID = tr_sell.Portfolio_PortfolioID
                          AND (
                                ts2.Time < tr_sell.Time
                                OR (ts2.Time = tr_sell.Time AND ts2.TradeID <= tr_sell.TradeID)
                              )
                      )
                ORDER BY t_b.Time ASC, t_b.TradeID ASC
                LIMIT 1
            )
        ) * tr_sell.Volume
        - tr_sell.StampDuty
        - tr_sell.CapitalGainTax
    ), 2) AS Total_Realized_PNL
FROM TradeRecord tr_sell
JOIN Stock s ON tr_sell.Stock_Code = s.Code
JOIN Portfolio p ON tr_sell.Portfolio_PortfolioID = p.PortfolioID
WHERE tr_sell.Direction = 'Sell'
  AND tr_sell.Portfolio_PortfolioID = 1
GROUP BY s.TradeCurrency, p.Name;
```

Query 3 Result: Total Realized P&L by Portfolio and Currency

- The query aggregates realized profit for sell trades after stamp duty and capital gain tax.
- `Main_Aggressive` shows total realized P&L of 2067.75 in USD.

                                OR (ts2.Time = tr_sell.Time AND ts2.TradeID <= tr_sell.TradeID)
                              )
                      )
                ORDER BY tr_b.Time ASC, tr_b.TradeID ASC
                LIMIT 1
            )
        ) * tr_sell.Volume
        - tr_sell.StampDuty
        - tr_sell.CapitalGainTax
    , 2) AS Net_Realized_Profit
FROM TradeRecord tr_sell
JOIN Portfolio p ON tr_sell.Portfolio_PortfolioID = p.PortfolioID
JOIN Stock s ON tr_sell.Stock_Code = s.Code
JOIN Company c ON s.Company_Name = c.Name
JOIN Exchange e ON s.Exchange_Code = e.Code
WHERE tr_sell.Direction = 'Sell'
  AND p.PortfolioID = 1
ORDER BY s.TradeCurrency, tr_sell.Time, tr_sell.TradeID;
```

Query 4 Result: Transaction-Level Realized Profit Detail

- The detail query shows each sell transaction together with its FIFO buy match and tax deductions.
- Portfolio 1 contains one NVDA gain, one AAPL loss, and one break-even NVDA exit.

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

PID	Portfolio_Name	Transaction_Time	Company_Code	Company_Name	Exchange	Currency	Volume	Matching_Buy_Price	Selling_Price	StampDuty	CapitalGainTax	Net_Realized_Prof
1	Main_Aggressive	2026-04-02 13:30:00	NVDA	NVIDIA Corp	NASDAQ Market	USD	500	175.8600	177.3900	0.0000	114.7500	650.25
1	Main_Aggressive	2026-04-02 14:15:00	AAPL	Apple Inc.	NASDAQ Market	USD	600	256.4300	251.9000	0.0000	0.0000	-2718.00
1	Main_Aggressive	2026-04-02 15:30:00	NVDA	NVIDIA Corp	NASDAQ Market	USD	200	177.3900	177.3900	0.0000	0.0000	0.00

Query 5 SQL: Negative-Growth Companies with PE Ratio

```sql
SELECT
    c.Name AS Company_Name,
    s.Code AS Stock_Code,
    s.TradeCurrency AS Currency,
    e.Name AS Exchange_Name,
    s.Industry,
    c.NetProfitGrowth AS Growth_Rate,
    CASE
        WHEN md.EPS IS NOT NULL AND md.EPS <> 0
            THEN ROUND(md.Close / md.EPS, 2)
        ELSE NULL
    END AS PE_Ratio
FROM Stock s
JOIN Company c ON s.Company_Name = c.Name
JOIN Exchange e ON s.Exchange_Code = e.Code
JOIN MarketData md ON s.Code = md.Stock_Code
WHERE c.NetProfitGrowth < 0
  AND DATE(md.Date) = '2026-04-02'
ORDER BY c.NetProfitGrowth ASC;
```

Query 5 Result: Negative-Growth Companies with PE Ratio

- The screening query joins company, stock, exchange, and market data, then filters for negative profit growth.
- The output includes Chagee, BYD, JPMorgan Chase, and China Mobile with computed PE ratios.

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

Company_Name	Stock_Code	Currency	Exchange_Name	Industry	Growth_Rate	PE_Ratio
Chagee Holdings	CHA	USD	NASDAQ Market	Consumer Disc	-0.5000	11.55
BYD Company	002594	CNY	Shenzhen Stock Exchange	Automotive	-0.1900	28.39
BYD Company	01211	HKD	HK Exchanges and Clearing	Automotive	-0.1900	26.23
JPMorgan Chase	JPM	USD	New York Stock Exchange	Banking	-0.0200	13.93
China Mobile	00941	HKD	HK Exchanges and Clearing	Telecom	-0.0100	11.42
China Mobile	600941	CNY	Shanghai Stock Exchange	Telecom	-0.0100	14.73

Query 6 SQL: Portfolios with Repeated Sell Activity

```sql
SELECT
    p.PortfolioID,
    p.Name AS Portfolio_Name,
    s.TradeCurrency,
    COUNT(*) AS Num_Sell_Trades,
    ROUND(SUM((tr.ExecutionPrice * tr.Volume) - tr.StampDuty - tr.CapitalGainTax), 2) AS Total_Sell_Amount_After_Tax
FROM TradeRecord tr
JOIN Portfolio p ON tr.Portfolio_PortfolioID = p.PortfolioID
JOIN Stock s ON tr.Stock_Code = s.Code
WHERE tr.Direction = 'Sell'
GROUP BY p.PortfolioID, p.Name, s.TradeCurrency
HAVING COUNT(*) >= 2;
```

Query 6 Result: Portfolios with Repeated Sell Activity

- The query groups sell trades by portfolio and currency, then keeps only groups with at least two sells.
- Three portfolio-currency groups qualify, including `Main_Aggressive` in USD.

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

PortfolioID	Portfolio_Name	TradeCurrency	Num_Sell_Trades	Total_Sell_Amount_After_Tax
1	Main_Aggressive	USD	3	275198.25
2	Retirement_Fund	USD	2	59788.72
4	Dividend_Growth	HKD	2	177712.11

Technical Highlights

- Primary-key and foreign-key structure organizes the schema around clean links between portfolios, trades, stocks, exchanges, strategies, factors, and market data.
- Multi-table joins support realistic business reporting instead of isolated table lookups.
- Nested subqueries and a CTE with cumulative logic are used to model FIFO cost basis for sell transactions.
- Query design is business-oriented: taxes are exchange specific, realized profit is portfolio specific, and screening logic uses both fundamentals and market metrics.
- The overall logic moves from raw records to decision-ready outputs: base tables store data, update queries calculate tax fields, nested queries resolve FIFO matching, and summary queries transform those results into reports.
- The project reflects real trade-analysis ideas such as stamp duty, capital gain tax, FIFO matching, valuation ratios, and realized profit measurement.

Bonus Prototype Demo

- We completed the bonus task by building a simple local Flask application connected to the MySQL trade database.
- The implementation uses:
  - Flask for routing and page rendering
  - PyMySQL for direct database access
  - HTML templates for dashboard, company browser, trade CRUD, reports, and connection settings
  - SQL queries that reuse the project tables instead of mock data
- The prototype is local only, with no authentication and no deployment, which matches the project bonus description.
- This extension shows that the database is not only well designed in SQL, but also usable in a small application workflow.

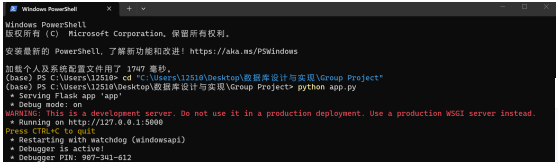
Prototype Implementation Logic

- The prototype follows the same logic as the database project and turns the schema into a small usable application.
- Step 1: start the Flask app locally in PowerShell with `python app.py`.
- Step 2: open the connection settings page and enter host, port, username, password, target schema, and SSL option.
- Step 3: after the connection test succeeds, the app runs SQL against the actual MySQL database and displays live results.
- Step 4: the interface supports browsing reference data, viewing summarized dashboard metrics, reading query-based reports, and editing `TradeRecord` rows.
- This design keeps the architecture simple: browser $\rightarrow$ Flask routes $\rightarrow$ PyMySQL queries $\rightarrow$ MySQL database.

Prototype Setup and Secure Connection

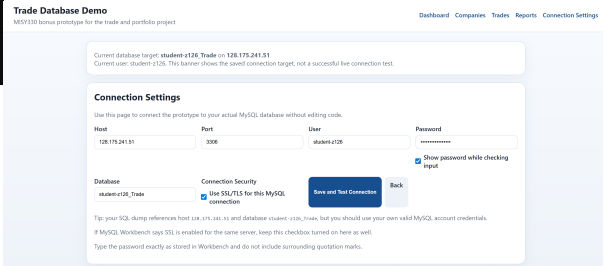
Local startup

- The Flask server is launched from PowerShell inside the project folder.
- The app runs locally at `http://127.0.0.1:5000`.
- This keeps the demo simple and classroom ready.



Database connection

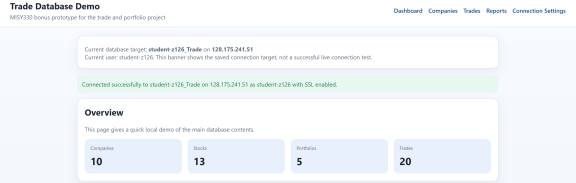
- A settings page lets us configure the real MySQL target without editing code.
- The connection uses the course server, project schema, user credentials, and SSL/TLS because Workbench confirmed secure access.
- This page also helped us debug connection issues step by step during implementation.



Prototype Running Result

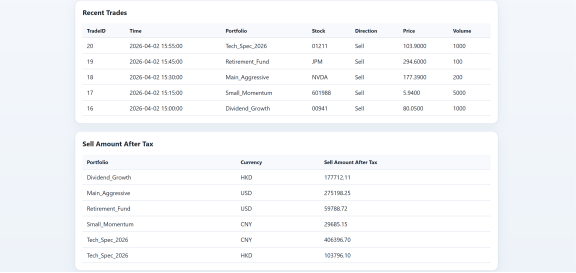
Connection success and dashboard

- After a successful test, the app confirms the database target and SSL status.
- The dashboard immediately shows live counts for companies, stocks, portfolios, and trades.
- This proves the Flask app is reading real data from the database.



Data display and reporting

- The dashboard continues with recent trades and a sell-amount-after-tax summary.
- Other pages also support company browsing, trade CRUD, and query-based reports.
- Together, the prototype demonstrates a complete local front-end workflow on top of the project database.



Recent Trades

TradeID	Time	Portfolio	Stock	Direction	Price	Volume
20	2026-04-02 15:55:00	Tech_Spec_2026	01211	Sell	103.9000	1000
19	2026-04-02 15:45:00	Retirement_Fund	JPM	Sell	294.6000	100
18	2026-04-02 15:30:00	Main_Aggressive	NVDA	Sell	177.3900	200
17	2026-04-02 15:15:00	Small_Momentum	601988	Sell	5.9400	5000
16	2026-04-02 15:00:00	Dividend_Growth	00941	Sell	80.0500	1000

Sell Amount After Tax

Portfolio	Currency	Sell Amount After Tax
Dividend_Growth	HKD	177712.11
Main_Aggressive	USD	275198.25
Retirement_Fund	USD	59788.72
Small_Momentum	CNY	29685.15
Tech_Spec_2026	CNY	406396.70
Tech_Spec_2026	HKD	103796.10

Challenges and Improvements

Challenges

- Designing a schema that connects market data, strategy rules, and trade records without redundancy
- Implementing FIFO-related logic with SQL subqueries and trade ordering
- Handling exchange-specific tax rules across HK, mainland China, and US markets
- Maintaining consistent key values across all sample records

Future Improvements

- Add views for reusable reporting outputs
- Add stored procedures or functions for tax and FIFO calculation
- Extend the Flask prototype with more pages, filters, and form validation
- Add authentication and user-role control if the prototype is expanded beyond a classroom demo
- Extend market data history for richer performance analytics

Current version already includes a working local Flask prototype, but it is still intentionally lightweight and focused on classroom demonstration.

Conclusion

- This database integrates business reference data, market data, strategy rules, and transaction records into one consistent trade-analysis system.
- The project supports meaningful business tasks such as tax calculation, FIFO cost matching, stock screening, and portfolio profit reporting.
- Overall, the system demonstrates how database design and SQL implementation can support practical portfolio trading analysis.

Contribution and AI Usage

- **Yingqi Tan:** business background, presentation organization, and final review.
- **Zhesheng Xu:** schema design, ER/logical modeling, and MySQL implementation.
- **Hao Yang:** SQL query design, result verification, and slide integration.
- **Shared contribution:** all members discussed the database logic, reviewed the project outputs, and understood the complete workflow.
- **AI usage statement:** AI tools were used appropriately for debugging, wording refinement, and presentation drafting support; the database design, SQL logic, and final verification were completed and checked by the group.

Any Questions?

Thank you for listening.
